

Ingestion

1. Load in libraries
2. Load in main raw data
3. Clean main data (bus_stops)
 - a. Lowercase and replace periods with underscores for variable names
 - b. Remove commas from numbers in numeric entries (objectid, stop_id, stop_code)
 - c. Create a new column indicating whether the routes going through a bus stop are only RideOn or include Metro buses
4. Clean external data (rideon_stops)
 - a. Lowercase variable names
 - b. Convert stop_code type from integer to character for joining
5. Join bus_stops and rideon_stops datasets using stop_code
6. Write csv files for rideon_stops and final clean dataset (bus_stops_clean)

Notes: The final cleaned dataset does include NAs (682) in the columns from the rideon_stops dataset because not every stop_code in rideon_stops matched a stop_code in bus_stops. I decided to keep these NAs because the entire rows are not empty and they still include entries to columns that are useful for my analysis.
