

Analysis

1. Load in required libraries
2. Load in processed dataset (bus_stops_clean)
3. Perform Chi-squared test: Is there a statistically significant difference in infrastructure between RideOn and Metro bus stops?
 - a. All amenities (benches, shelters and trashcans) have significant p-values even after Bonferroni correction. This means that the type of route (Metro vs. RideOn) is strongly associated with whether a stop has infrastructure which reflects what was seen in the visualizations.
 - b. While we know there is an association, chi-squared tests don't indicate why.
